"Language Map"

(Travel resource platform)

04.2022
—

Stephon Stokley

Overview

A platform where you can become more aware of how learning a language opens up doors. It'll give resources to learn languages, show you where you can use them, etc.

Features/Specifications

1. A landing page detailing the project and my goals.

2. An (beta) interactive map of the world where you're able to click what languages you know. Upon doing so, you can see (highlighted on the map), where your known languages/languages you're learning are spoken. You will also be able to select a country (and even parts) to see what languages are spoken there.

3. A contact page to suggest new features, collabs, or general ideas.

4. A resource/education page to help people find resources for their desired languages or even communities around those languages.

Mission and Projects

1. Language Map:

    Brief Overview: An (beta) interactive map of the world where you're able to click what languages you know. Upon doing so, you can see (highlighted on the map), where your known languages/languages you're learning are spoken. You will also be able to select a country (and even parts) to see what languages are spoken there.

    Why: Makes traveling easier and seeing how practical your language even is, in terms of diminishing returns.

    Already Existing companies:

2. Resource Connection:

    Brief Overview: A resource/education page to help people find resources for their desired languages or even communities around those languages.

    Why: Seems bare minimum a language-based website should be able to connect you to other communities that are language based, especially since there are already existing good resources out there. Like if you discover you want to go to poland but don't know any polish, I think it's easier for me to connect you than for you to go out there and find the resources yourself.

User Interface Design and Prototype

Because this project is pretty similar to my last project, it'll pretty much have the same layout:

Navigation Structure

The web application will have a navigation bar at the top and other links within pages that lead to other components. For example, if you were to click on the map feature, it'll bring up the map.
